

ALPHA DATA

PRESS RELEASE

Alpha Data completes infrastructure works for ACC

September 2009

Alpha Data, the UAE's leading multi-disciplined systems integrator, today announced the completion of its infrastructure development project catering to each of the business units of Arabian Construction Company (ACC).

Started in May 2009, Alpha's role was to centralize the business processes of ACC's business units and construction sites, based outside of the UAE. SAP was deployed on the real estate and construction business units within the Abu Dhabi office, which in turn grants access to ACC's international operations.

Working to provide the optimal design for the data centre and efficiently activate the remote access for applications from outside ACC's construction sites, Alpha Data used NORTEL for the core switching and edge switching to deliver voice data video services within the organization and gave ACC's outside offices and sites connectivity for video conferencing.

Juniper was used for the security infrastructure and secured remote access in addition to the network Infrastructure. The technology was strictly used to deliver secured redundant access to ACC data centre.

"Alpha Data's ability to seamlessly bring together the variety of technologies and solutions provided us with considerable reductions in our operational cost," said Mazen Al Mamlouk, IT & Finance Manager for Arabian Construction Company.

"Alpha Data is, again, pleased to be recognised for its rare ability, in the UAE market, to offer a full service, multi-disciplined understanding of how best to achieve the business requirements of ACC," said Sandeep Kokroo, Manager – Networking Division, Alpha Data.

"Working closely with ACC's management and IT Department, Alpha Data was able to ensure that we guaranteed the best optimal solution and design, with full consideration given to the minimum downtime permissible for fluid business operations."
